EAGLE SYNDROME AND TRAUMATIC CAROTID ARTERY DISSECTION: A CASE REPORT

CIRO SCARPATO, GIULIA PERROTTA, RAFFAELE ORNELLO, CINDY TISEO, ENRICO
COLANGELI, B. ORLANDI, F. DE SANTIS, F. NOTTURNO, SIMONA SACCO

Scuola di specializzazione in Neurologia

CASO CLINICO: ANAMNESI

- Maschio, di 51 anni
- Ipertensione arteriosa e calcolosi renale
- Lavoro sedentario
- Calcetto settimanale

CASO CLINICO: SINTOMI

- dolore spalla dx,
regione occipitale e
latero-cervicale dx
- difficoltà nella
deglutizione

CASO CLINICO: PS

- Esami ematici
- TC encefalo smdc
- Consulenza neurologica:
- deviazione della lingua a dx
- lieve ptosi occhio destro

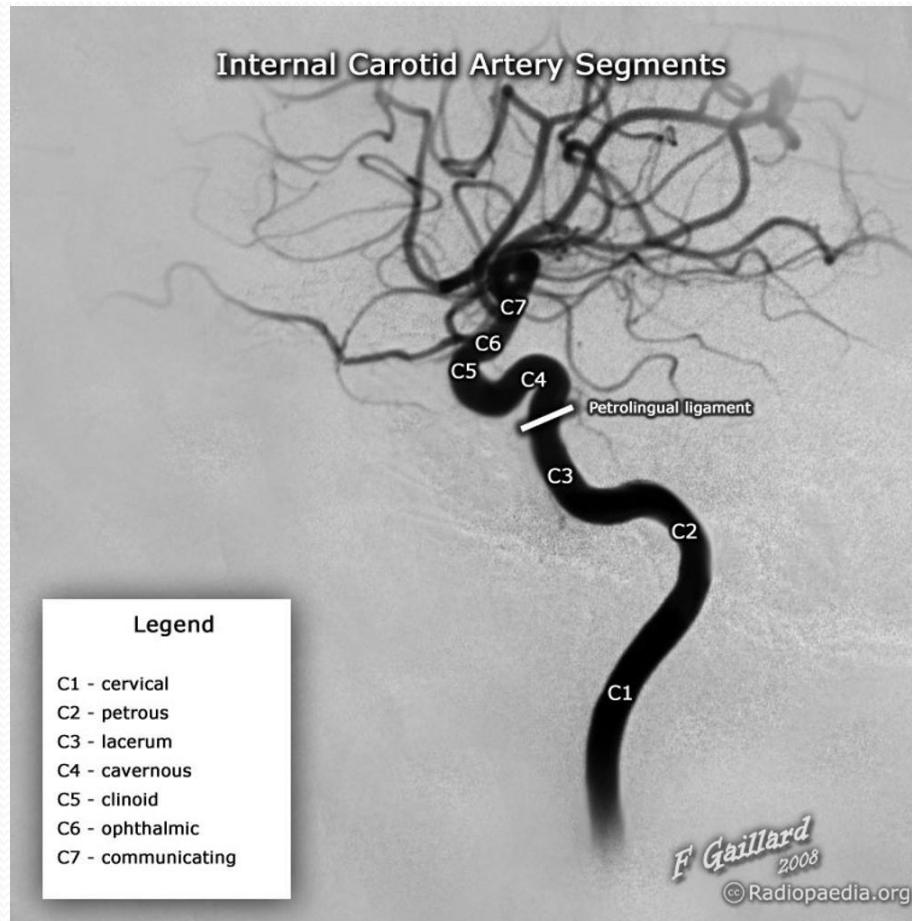

Figura 7.13 Paralisi del XII di destra. L'emilingua destra è atrofica e la lingua devia verso destra se sporta fuori del cavo orale.

CASO CLINICO: DIAGNOSI

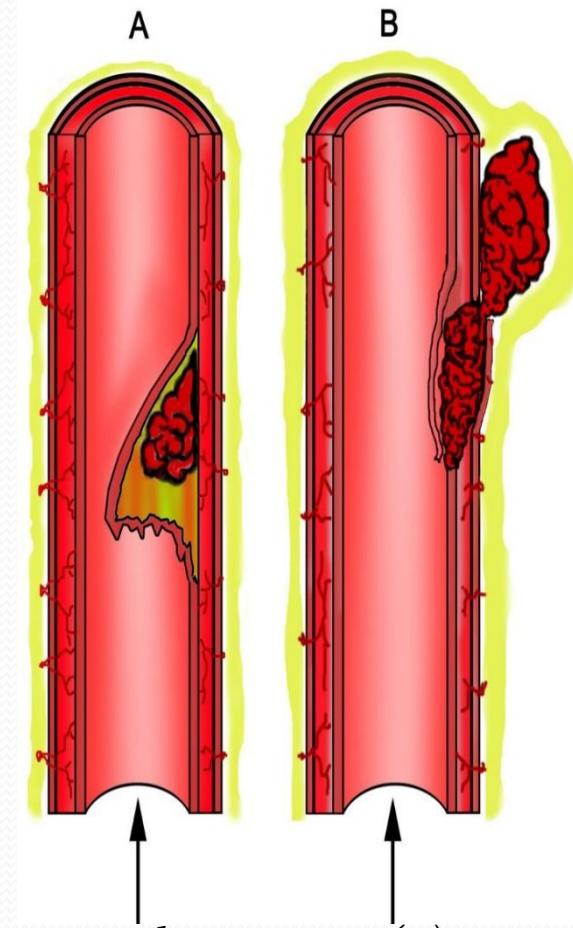

- **EcocolorDoppler-TSA:** Non si rilevano segni di dissecazione nel tratto extracranico della carotide interna destra né alterazioni di flusso.
- **Angio-RM:** vasti depositi trombotici nel tratto cervicale-intrapetoso della carotide interna destra con *aspetto filiforme* del lume del vaso a tale livello
- **Angio-TC:** aumento di calibro dell'arteria carotide interna nel tratto cervicale-origine del tratto intrapetoso con *anello di iperdensità periferica*; dopo mdc il vaso presenta un *anello di ipodensità con lume vero eccentrico*. Il reperto è suggestivo per *ematoma intramurale* con riduzione di calibro del lume del vaso

BOUTHILLIER CLASSIFICATION OF INTERNAL CAROTID ARTERY SEGMENTS

CAROTID ARTERY DISSECTION

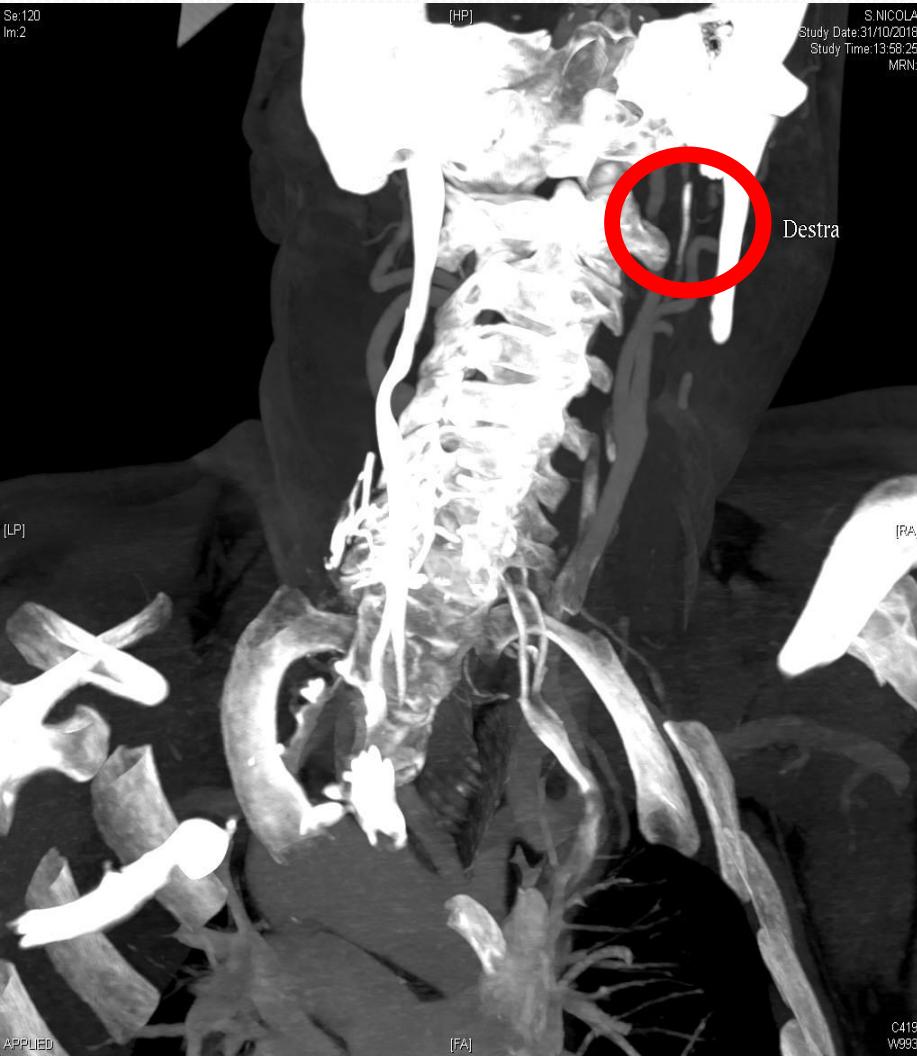

- separation of the vessel wall layers following either a tear in the intima or rupture of the *vasa vasorum* → bleeding within the media and formation of intramural hematoma;
- potential source of thromboembolism;
- can be traumatic (young patients) or spontaneous (older patients).

MECHANISM OF INJURY

- TCAD may result from a direct blow to anterolateral aspect of the neck;
- extreme extension/rotation , distraction/extension, distraction/flexion of the neck;
- vasocompression between C-spine and mandibula during a hyperinclination trauma.

EAGLE SYNDROME

- Eagle syndrome is caused by an **elongated styloid process or a calcified stylohyoid and stylomandibular ligament;**
- Elongation of the styloid process (>3 cm) with/without anomalous direction;
- Calcified styloid ligament;
- Incidence 4-28%;

Precision and Future Medicine 2017;1(4):173-176

EAGLE SYNDROME

- The elongated styloid process may compress the **glossopharyngeal nerve** and surrounding structures, causing recurrent **odynophagia** and **cervical pain**;
- The syndrome may present with the **dissection of the carotid artery**, resulting in a transient ischemic attack or stroke.

CASO CLINICO: TERAPIA

- Coumadin 5mg embricato con Clexane 6000 UI x 2

CONCLUSIONS

- CAD is a major cause of stroke in young adults.
- The primary goals: promptly save at-risk brain tissue and prevent additional ischemia or stroke recurrence.
- identification of the pathophysiology underlying CAD is required in order to estimate the risk of recurrent cerebral ischemia and to select optimal treatment methodology.
- Although Eagle syndrome is a rare cause of CAD, it can be treated with surgical resection.
- when the cause of CAD is unclear, it is necessary to determine whether the distal portion of the styloid process is in close contact with the carotid artery.
