MIBG-SCINTIGRAPHY IN PREMOTOR STAGE OF PD

REM BEHAVIOUR DISORDER (RBD)

E' una parassonnia clinicamente caratterizzata da sogni "spiacevoli" (essere attaccati o derubati) e comportamenti vigorosi durante la fase del sonno rem in cui il paziente sembra vivere il sogno (scalciando, cadendo dal letto, urlando);

RBD puo' essere classificato come idiopatico o secondario (quando esiste una causa ben precisa);

in aggiunta esiste una forma sintomatica inserita nel contesto di un quadro clinico di una malattia definita;

RBD SI RISCONTRA NEL 60% DEI PAZIENTI CON MALATTIA DI PARKINSON;

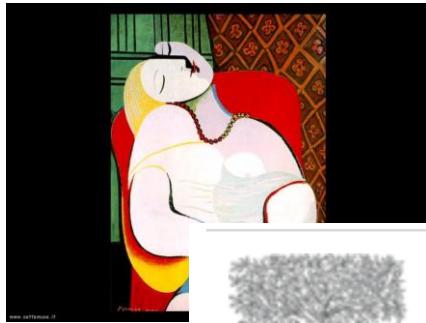

Figure 1: Sleep-related injury on the forehead of patient with idiopathic rapid eye movement sleep behaviour disorder who jumped out of bed and hit the nightstand

Figure 2: Bed rails and chair barricade as protective measures to prevent falling out of bed

RBD: BIOMARKER OF PARKINSON'S DISEASE ?

Neurodegenerative disease status and post-mortem pathology in idiopathic rapid-eye-movement sleep behaviour disorder: an observational cohort study

Alex Iranzo, Eduard Tolosa, Ellen Gelpí, José Luis Molinuevo, Francesc Valldeoriola, Mónica Serradell, Raquel Sanchez-Valle, Isabel Vilaseca, Francisco Lomeña, Dolores Vilas, Albert LLadó, Carles Gaiq, Joan Santamaría

2013

82% dei pazienti con iRBD
sviluppa una
malattia neurodegenerativa
definita dopo 7 anni

44% PD;
39% LBD;
3% MSA;
14% MCI;

"These findings suggest that iRBD is not really idiopathic, but in most cases is an integral part of a defined neurodegenerative syndrome. Perhaps the term idiopathic RBD should be abandoned" Iranzo et al.

MIBG SCINTIGRAPHY IN PREMOTOR PHASE OF PD:

Reduced cardiac ^{123}I -MIBG scintigraphy in idiopathic REM sleep behavior disorder

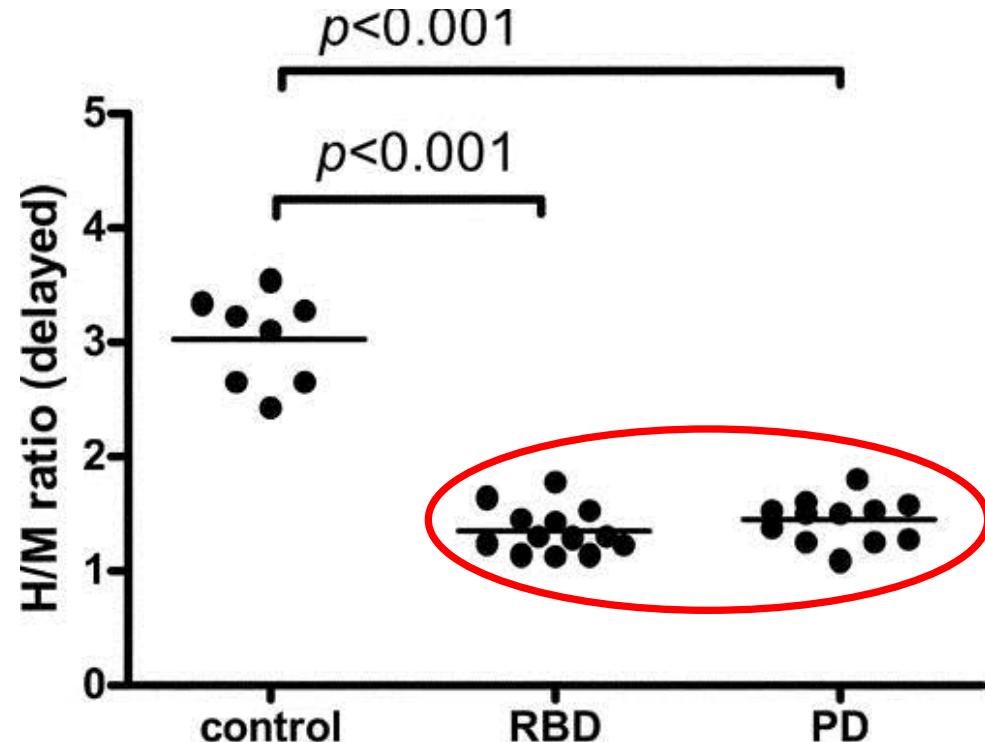

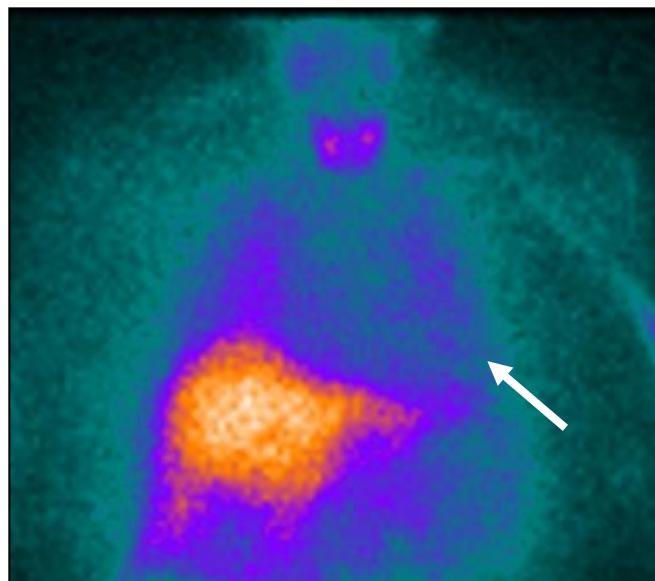

Abstract—Idiopathic REM sleep behavior disorder (RBD) may represent prodromal synucleinopathies. We report markedly reduced cardiac ^{123}I -metaiodobenzylguanidine uptake, consistent with the loss of sympathetic terminals, in idiopathic RBD. We also demonstrate that this reduction is of the same magnitude as that found in patients with Parkinson disease. The results are consistent with the hypothesis that idiopathic RBD in older patients is a forme fruste of Lewy body disease.

CONCLUSIONI

La scintigrafia miocardica puo' essere un valido supporto per la diagnosi preclinica e premotoria della Malattia di Parkinson e di Parkinsonismi atipici.

In pazienti con RBD-fase premotoria di Malattie a corpi di Lewy come la Malattia di Parkinson, la scintigrafia miocardica è patologica.

In pazienti con RBD-fase premotoria di Malattie non a corpi di Lewy la scintigrafia miocardica, quali Parkinsonismi atipici puo'essere normale
